The present sequence represents fusion protein of murine osteoprotegerin is a ligand (OPGL) and tetanus toxoid P30 epitope. Osteoprotegerin is a secreted member of the tumour necrosis factor receptor family, which blocks osteoclasteogenesis in a dose dependent manner. The OPGL protein is synthesised as a type II transmembrane protein. The murine and human OPGL polypeptides are 87% homologous. OPGL is a potent osteoclast differentiation factor when combined with CSF-1. It is not capable of inducing osteoclast differentiation in the absence of CSF-1. OPGL is also an activator of mature osteoclasts. The specification describes a method for the in vivo down-regulation of OPGL activity in an animal. The method comprises using at least one OPGL polypeptide or subsequence, and/or at least one OPGL nallogue to induce an immune response in the animal. The method and OPGL polypeptide are useful for treating, preventing and ameliorating osteoporosis or other diseases or conditions characterised by excessive bone resorption
                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (IL5) and tumour necrosis factor alpha (TNF, TNFalpha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is human TNFalpha variant protein with an inserted tetanus toxoid P2 and P30 epitopes. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                              New immunogenic analogue of a polymeric protein, useful for preparing a composition for treating inflammatory diseases e.g. arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Multimeric protein; interleukin 5; IL5; TNFalpha; inflammatory disease; tumour necrosis factor alpha; gene therapy; arthritis; human; mutant; mutein; variant; tetanus toxoid; epitope.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   125. .145

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents fusion protein of murine osteoprotegerin is a secreted member of the tumour necrosis factor receptor family, which is a secreted member of the tumour necrosis factor receptor family, which blocks osteoclastogenesis in a dose dependent manner. The OPGL protein is synthesised as a type II transmembrane protein. The murine and human OPGL COLYpeptides are 87% homologous. OPGL is a potent osteoclast the manner of differentiation factor when combined with CSF-1. It is not capable of inducing osteoclast differentiation in the absence of CSF-1. OPGL is also a activator of mature osteoclasts. The specification describes a method for the in vivo down-regulation of OPGL activity in an animal. The method comprises using at least one OPGL activity in an animal. The method comprises using at least one OPGL polypeptide or subsequence, and/or at method and OPGL polypeptide are useful for treating, preventing and ameliorating osteoporosis or other diseases or conditions characterised by excessive bone resorption
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                      In vivo down-regulation of osteoprotegerin ligand (OPGL) activity used to treat, prevent and ameliorate osteoporosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Multimeric protein; interleukin 5; IL5; TNFalpha; inflammatory disease; tumour necrosis factor alpha; gene therapy; arthritis; human; mutant; mutein; variant; tetanus toxoid; epitope.

New protein comprising at least one epitope of membrane immunoglobulin B (IgE) and being free of epitopes of serum IgE, useful for treating an IgE -mediated allergic disease or condition, e.g. asthma, allergic rhinitis
                                                                                                                                                                                                                                                                                                            The present sequence is that of a fusion construct comprising human membrane IgE (mIgE) fused at its N-terminal end to a human IgE leader sequence to enhance protein expression, and fused at its C-terminal end via a proteolytic cleavage site to tetanus toxoid (TT) Th epitope to enhance immune response, and a 6His tag sequence. A plasmid comprising DNA encoding this fusion protein was used as a DNA vaccine to immunise HLA-A2 mice. Epitope-specific responses were observed. The DNA is an example of nucleic acid molecules of the invention that encode a mIgE epitope that is free of serum IgE epitopes and which optionally includes for trating an individual susceptible to, or having, an IgE mediated allergic disease, e.g. asthma, allergic rhinitis, atopic dermatitis, anaphylaxis or urticaria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mucin repeat, MUC-1 analogue, vaccination, self-protein, cancer, cytotoxic T-lymphocyte immunity, breast cancer, prostate cancer, cell-associated peptide antigen, foreign epitope.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         100.0%; Score 112; DB 8; I

                                                                                                                                                                                                                     The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (IL5) and tumour necrosis factor alpha (TNP, TNPalpha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is human TNPalpha variant protein with an inserted teranus toxoid P2 and P30 epitopes. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                ô
                                                                                                                                                    New immunogenic analogue of a polymeric protein, useful for preparing a composition for treating inflammatory diseases e.g. arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               IgE; antibody; antiallergic; vaccine; antiasthmatic; antiinflammatory; dermatological; immunosuppressive; tetanus toxoid; human.
                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention provides carrier proteins comprising at least 5 CD4+ T cell epitope. The carrier protein comprises at least 1 of N6, N10 or N19. The carrier protein can be prepared by expressing a vector comprising a nucleic acid molecule encoding the protein, in a host cell and recovering the expressed protein. The carrier protein can also be produced by (a) constructing oligonucleotide molecules that encode peptide epitopss; (b) annealing the oligonucleotide molecules that encode peptide epitopss; (b) duplexes into an expression vector; (d) introducing the expression vector into a host cell; and (e) isolating the fusion protein produced from a culture of the host cells. The carrier protein can be used as a protective immunogen in the control of diseases caused by encapsulated bacteria. The present sequence represents the amino acid sequence of N10
                                                                                                                                                                                                                                                            Carrier proteins containing CD4+ epitopes useful for protecting against diseases caused by encapsulated bacteria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Carrier proteins containing CD4+ epitopes useful for protecting against diseases caused by encapsulated bacteria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Carrier protein; CD4+; T cell epitope; N6; N10; N19; immunogen; N11; encapsulated bacteria.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      8
                                                                                                                                                                                                                                                                                                                                                                                                                   This is an immunogenized WUC-1 analogue containing foreign epitopes P2 and P30. Immunogenic analogues of WUC-1 and, e.g. human prostate specific and P30. Immunogenic analogues of WUC-1 and, e.g. human prostate specific cat membrane antigen (hP8M) can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms (see features table). 10 regions suitable for the insertion of foreign T helper epitopes were identified.

The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. heSM, heregulin 2 (Her2) and/or fibroblast growth factor 80 (EGF8b). The method comprises cfecting simultaneous presentation by antigen producing cells (APCs) of effecting simultaneous presentation by antigen producing cells (APCs) of creaning inmune system of: (1) at least 1 CTL (cyctocxic T-1ymphocyte) group derived from the PA and/or at least 1 first T helper cell group which is confident animal. Analogues of human PSM, human HSM, human HSM, human HSM.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   human/murine FGFBD comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, FGFBD and Her2, respectively. Note: This sequence does not appear in the specification. It was made using the mucin repeat sequence (AAY92664), P2 and P30 (AAY92665-26), which appear on pages 220, 213 and 214 respectively, of the specification
                                                                                                                                                                                                                                                                                                       Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                        Dalum I;

                                                                            epitope. The carrier protein comprises at least 1 of N6, N10 or N19. The carrier protein comprises at least 1 of N6, N10 or N19. The carrier protein can be prepared by expressing a vector comprising a nucleic acid molecule encoding the protein, in a host cell and recovering the expressed protein. The carrier protein can also be produced by (a) annealing the oligonucleotide molecules that encode peptide epitopes, (b) annealing the oligonucleotides to form duplexes, (c) introducing the oligonucleotides to form duplexes, (c) introducing the into a host cell; and (e) isolating the fusion protein produced from a protective immunogen in the control of diseases caused by encapsulated bacteria. The present sequence represents the amino acid sequence of N11 polyepitope carrier protein construct
                                                          invention provides carrier proteins comprising at least 5 CD4+ T cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Growth differentiation factor 8; GDF-8; myostatin; tetanus toxin; T-cell epitope; down-regulation; vaccine; muscle; meat; cachexia; cardiant; human; mutant; mutein.

The present sequence is that of AutoVac construct GDP-8 dimer comprising 2 copies of the 109-amino acid C-terminal region of human growth differentiation factor 8 (GPF-8, see AAF20141) covalemently connected through the P2 and P30 T-cell epitopes (see AAB20143-44) of tetanus corrected through the P2 and P30 T-cell epitopes (see AAB20143-44) of tetanus corrected the rank is an object of the invention to produce a recombinant corrected to receive the muscle growth rate of farm animals. The vaccines in order to increase the muscle growth rate of farm animals. The vaccines (see AAB20145-53) are capable of breaking autotolerance against corrected autologous GDF-8. They comprise the C-terminal portion of human GDF-8 in which a portion of the native sequence is replaced by a T-cell epitope correction of the protein. Nucleic acids encoding the GDF-8 variants can be used for genetic immunisation of the animals. Down-regulation of GDF-8 activity can increase muscle mass by up to at least 45% in cattle, pigs activity can increase muscle mass by up to at least 45% in cattle, pigs corrected and poultry used for math advanced and poultry used for math growth is pronounced and for such as cancer cachexia where muscle atrophy is pronounced and for patients suffering from acute and chronic heart failure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                  Increasing the muscle mass of animals used in meat production by down regulating growth differentiation factor 8 (GDF-8) activity in the animal through induction of anti-GDF-8 antibody production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Multimeric protein; interleukin 5; IL5; TNFalpha; inflammatory disease;

The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (IL5) and tumour necrosis factor alpha (TNF TNFalpha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is a fusion construct which comprises 2 human interleukin 5 (IL5) monomers joined by tetanus toxoid epitopes p30 and P2. This sequence is used to illustrate the method of the
                                                                                                                                                               New immunogenic analogue of a polymeric protein, useful for preparing a composition for treating inflammatory diseases e.g. arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Multimeric protein; interleukin 5; IL5; TNFalpha; inflammatory disease; tumour necrosis factor alpha; gene therapy; arthritis; interleukin 5; IL5; epitope; human; tetanus toxoid; chimeric; variant; mutant; mutein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (IL5) and tumour necrosis factor alpha (TNF, TNFalpha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is a funion construct which comprises 2 human interleukin 5 (ILS) anomers joined by tetamus toxoid epitopes P30 and P2. This sequence is used to illustrate the method of the
                                                                                                                                                                                               New immunogenic analogue of a polymeric protein, useful for preparing a composition for treating inflammatory diseases e.g. arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Multimeric protein; interleukin 5; IL5; TNFalpha; inflammatory disease; tumour necrosis factor alpha; gene therapy; arthritis; interleukin 5; IL5; epitope; human; tetanus toxoid; chimeric.

The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (IL5) and tumour necrosis factor alpha (TWF, TWRPIDPA) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is a fusion construct variant which comprises 2 human interleukin 5 (IL5) monomers joined by diglycine linker and including terminally positioned tetanus toxoid epitopes P30 and P2. This sequence is used to illustrate the method of the invention Sequence 287 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to a novel immunogenic composition comprising an IL-13 (interleukin-13) element that is capable of driving an immune cresponse by recognising human IL-13 and one or more foreign T-cell espitopes. Specifically, it refers to a method for producing a human chimeric IL-13 immunogen formulated in a appropriate manner to generate a human vaccine. The present invention describes human chimeric IL-13 sequences as having a similar conformational shape to native human IL-13 while having sufficient amino acid sequence diversity, attributable to non-human mammalian species, to enhance its immunogenicity. Accordingly, connected the method results in a reduction in airway hyper-responsiveness (AHR), mucus hyper-secretion, goblet cell metaplasia, sub-epithelial fibrosis of the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene therapy to treat individuals suffering from or susceptible to chronic obstructive pulmonary disease (COPD), asthma or atopic dermatitis. This invention relates to a novel immunogenic composition comprising an IL-13 (interleukin-13) element that is capable of driving an immune compose by recognising human IL-13 and one or more foreign T-cell epitopes. Specifically, it refers to a method for producing a human chimeric IL-13 immunogen formulated in an appropriate manner to generate a human vaccine. The present invention describes human chimeric IL-13 sequences as having a similar conformational shape to native human II-13 cwhile having sufficient anno acid sequence diversity, attributable to non-human mammalian species, to enhance its immunogenicity. Accordingly, che method results in a reduction in airway hyper-responsiveness (AHR), mucus hyper-secretion, goblet cell metaplasia, sub-epithelial fibrosis of the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene therapy to treat individuals suffering from or susceptible to chronic obstructive pulmonary disease (COPD), asthma or atopic dermatitis. This polypeptide murine IL-13 protein and the tetani p30 peptide under the control of a composition in the figure composition. NOTE: This sequence is given in the figure but is not further referred to in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New vaccine composition useful for treating asthma, Chronic obstructive pulmonary disease or atopic disorders, e.g. dermatitis, comprises an immunogen generating an immune response against interleukin-13.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                               epitope. The carrier protein comprises at least 1 of N6, N10 or N19; The carrier protein comprises at least 1 of N6, N10 or N19; The carrier protein can be prepared by expressing a vector comprising a nucleic acid molecule encoding the protein, in a host cell and recovering the expressed protein. The carrier protein can also be produced by (a) constructing oligonucleotide molecules that encode peptide epitopes; (b) annealing the oligonucleotides to form duplexes; (c) introducing the duplexes into an expression vector; (d) introducing the expression vector into a host cell; and (e) isolating the fusion protein produced from a culture of the host cells. The carrier protein can be used as a protective immunogen in the control of diseases caused by encapsulated bacteria. The present sequence represents the amino acid sequence of N19 polyepitope carrier protein construct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               mouse; immunogenic; ID-13; interleukin-13; vaccine; airway hyper-responsiveness; AHR; mucus hyper-secretion; goblet cell metaplasia; sub-epithelial fibrosis; skin irritation; inhaled corticosteroid; ICS; dermatological; antiasthmatic; gene therapy; chronic obstructive pulmonary disease; COPD; asthma; atopic dermatitis; murine; peptide p30.
                                                                                                                                                                                                                                                                                                   The invention provides carrier proteins comprising at least 5 CD4+ T cell
                                                                                                                                                                                                                  Carrier proteins containing CD4+ epitopes useful for protecting against diseases caused by encapsulated bacteria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

This invention relates to a novel immunogenic composition comprising an IL-13 (interleukin-13) element that is capable of driving an immune CC IL-13 (interleukin-13) element that is capable of driving an immune compares by recognising human IL-13 and one or more foreign T-cell epitopes. Specifically, it refers to a method for producing a human chimeric IL-13 immunogen formulated in an appropriate manner to generate a human vaccine. The present invention describes human chimeric IL-13 sequences as having a similar conformational shape to native human IL-13 cwhile having sufficient amino acid sequence diversity, attributable to non-human mammalian species, to enhance its immunogenicity. Accordingly, cmcus hyper-secretion, goblet cell metaplasia, sub-epithelial fibrosis of the method results in a reduction in airway hyper-responsiveness (AHR), cmcus hyper-secretion, goblet cell metaplasia, sub-epithelial fibrosis of the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene therapy to treat individuals suffering from or susceptible to chronic obstructive pulmonary disease (COPD), asthma or atopic dermatitis. This polypeptide cmurine IL-13 protein and the tetani p30 peptide under the control of a cmv promoter of the invention. NOTE: This sequence is given in the figure course of turner is not further referred to in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                immunogenic, IL-13; interleukin-13; vaccine; airway hyper-responsiveness; AHR; mucus hyper-secretion; goblet cell metaplasia; sub-epithelial fibrosis; skin irritation; inhaled corticosteroid; ICS; dermatological; antiasthmatic; gene therapy; chronic obstructive pulmonary disease; COPD; asthma; atopic dermatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New immunogenic composition comprising an interleukin-13 (IL-13) element that drives an immune response recognizing human IL-13 and foreign T-cell epitopes, useful in treating, e.g. asthma or atopic dermatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

This invention relates to a novel immunogenic composition comprising an IL-13 (interleukin-13) element that is capable of driving an immune CC IL-13 (interleukin-13) element that is capable of driving an immune CC response by recognising human IL-13 and one or more foreign T-cell epitopes. Specifically, it refers to a method for producing a human conference of a human vaccine. The present inventional shape to native human IL-13 sequences as having a similar conformational shape to native human IL-13 while having sufficient amino acid sequence diversity, attributable to non-human mammalian species, to enhance its immunogenicity. Accordingly, con-human mammalian species, to enhance its immunogenicity. Accordingly, mucus hyper-secretion, goblet cell metaplasia, sub-epithelial fibrosis of the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene therapy to treat individuals suffering from or susceptible to chronic obstructive pulmonary disease (COPD), asthma or atopic dermatitis. This polypeptide is the pCDNcIL13p30newFC expression plasmid protein sequence of the invention. NOTE: This sequence is given in the figure but is not further referred to in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             airway hyper-responsiveness, ARR; mucus hyper-secretion; goblet cell metaplasia; sub-epithelial fibrosis; skin irritation; inhaled corticosteroid; ICS; dermatological; antiasthmatic; gene therapy; chronic obstructive pulmonary disease; COPD; asthma; atopic dermatitis; murine; peptide p30.
                                                                                                                                                                                                                                                                                                                                                                                 New vaccine composition useful for treating asthma, Chronic obstructive pulmonary disease or atopic disorders, e.g. dermatitis, comprises an immunogen generating an immune response against interleukin-13.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to a novel immunogenic composition comprising an IL-13 (interleukin-13) element that is capable of driving an immune IL-13 (interleukin-13) element that is capable of driving an immune C IL-13 (interleukin-13) element that is capable of driving an immune c Ecception Expectation by the construction and interpretation of the construction and the construction and the construction and the construction and the construction of sequences as having sufficient amino acid sequence diversity, attributable to non-human mammalian species, to enhance its immunogenicity. Accordingly, the method results in a reduction in airway hyper-responsiveness (AHR), mucus hyper-secretion, goblet cell metaplasia, sub-epithelial fibrosis of the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene therapy to treat individuals suffering from or susceptible to chronic obstructive pulmonary disease (CDPD), asthma or atopic dermatitis. This polypeptide is the pCDNcIL13p30newFC expression plasmid protein sequence of the invention. NOTE: This sequence is given in the figure but is not further referred to in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       immunogenic; IL-13; interleukin-13; vaccine; airway hyper-responsiveness; ARR; mucus hyper-secretion; goblet cell metaplasia; sub-epithelial fibrosis; skin irritation; inhaled corticosteroid; ICS; dermatological; antiasthmatic; gene therapy; chronic obstructive pulmonary disease; COPD; asthma; atopic dermatitis.
                                                                                                                                                                                                                                                                                                                                                                                                        New immunogenic composition comprising an interleukin-13 (IL-13) element that drives an immune response recognizing human IL-13 and foreign T-cell epitopes, useful in treating, e.g. asthma or atopic dermatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

The (G+C) content of the synthetic gene is increased by 47% wrt the native sequence. This eliminates six "terminator" regions which were found to be present in (A+T) rich regions. The terminators (termination/endo-nucleolytic processing/polyadenylation sites) were previously responsible for incomplete transcription of the mRNA. The elimination of these elements (using codon degeneracy) provided for successful expression in yeast of the tetanus toxin fragment C. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                    DNA sequence encoding tetanus toxin fragment C - useful in the manufacture of vaccines for immunity to tetanus utilising yeast as host
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Vaccine, shed antigen-specific B cell, idiotypic antibody, immune complex-mediated disease, autoimmune disease, tetanus protein,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to a novel immunogenic composition comprising an IL-13 (interleukin-13) element that is capable of driving an immune response by recognising human IL-13 and one or more foreign T-cell epitopes. Specifically, it refers to a method for producing a human chimeric IL-13 immunogen formulated in an appropriate manner to generate a human vaccine. The present invention describes human chimeric IL-13 equences as having a similar conformational shape to native human IL-13 while having sufficient amino acid sequence diversity, attributable to non-human mammalian appecies, to enhance its immunogenicity, Accordingly, the method results in a reduction in airway hyper-responsiveness (AHR), mucus hyper-secretion, goblet cell metaplasia, sub-epithelial fibrosis of the airways and skin irritation, as well as reducing the requirement for inhaled corticosteroids (ICS). As such, these compositions, which exhibit dermatcological and antiasthmatic activities, can be used via gene therapy to treat individuals suffering from or susceptible to chronic obstructive pulmonary disease (COPD), asthma or atopic dermatitis. This polypeptide is the pCDMmIL13p30 expression plasmid protein sequence of the chimeric mucus in the IL-13 protein and the tetani p30 peptide under the control of a CMV promoter of the invention. NOTE: This sequence is given in the figure but is not further referred to in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                      New vaccine composition useful for treating asthma, Chronic obstructive pulmonary disease or atopic disorders, e.g. dermatitis, comprises an immunogen generating an immune response against interleukin-13.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Tetanus toxin fragment C encoded by gene with increased G+C content.

The present sequence represents a fragment of tetanus protein, which is used as an immunostimulatory protein in vaccines of the invention. The specification describes a method for inducing an immune response reactive with idiotypes present on shed antigen-specific B cells (SAB) of an individual. The method involves administering a vaccine formulation comprising polynucleotide encoding an idiotype of an antibody that binds to an epitope of shed antigen. The method is useful for inducing an immune response reactive with idiotypes present on SAB of an individual. The method is useful for depleting shed antigen-specific B cells, and for treating immune complex-mediated disease progression in organ specific autoimmune disease exacerbated by humoral immune response against groups expressed on shed antigen. Or by plasma cell production of antibodies against groups of shed antigen. It is useful in cancer therapy and for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Delivery of a composition to the central nervous system or spinal cord - comprises administration of a non-toxic, proteolytic fragment of tetanus toxin in association with a molecule having biological function.
                  Inducing an immune response against shed antigen-specific B cell idiotypes, by administering a vaccine formulation comprising polymucleotides encoding an idiotypic determinant or peptides comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Tetanus toxin fragment C; TTC; central nervous system; CNS; spinal cord; proteolytic fragment; retrograde axonal transport; spinal cord disease; transport; neurodegenerative disease; motoneuron disease; amyotrophic lateral sclerosis; spinal muscular atrophy; therapy; ALS; SMA; neurodegenerative lysosomal storage disease; neuronal mapping.

This sequence represents the tetanus toxin fragment C (TTC). The invention relates to a method for in vivo delivery of a desired composition into a human or animal central nervous system (CNS) or spinal cord comprises administering a non-toxic, proteolytic fragment of tetanus coxin (TT) in association with at least a molecule having a biological toxin (TT) in association with at least a molecule having a biological troxin (TT) in association with at least a molecule having a biological coxin (TT) in association with at least a molecule having a biological coxin (TT) in a manapatic transport into the CNS or the spinal cord of the human or animal and of being delivered to different areas of the CNS or the spinal and of being delivered to different areas of the numns or animals with CNS or spinal cord disease, e.g. neurodegenerative and motoneuron diseases such as amyotrophic lateral sclerosis (ALS), spinal muscular atrophies (SMA) or neurodegenerative lysosomal storage diseases. Compositions comprising hybrid fragments of TT comprising and immunisations. Use of TT comprising fragments A, B and C results in the fragment C fragment C
                                                                                                                                                                                                                                                                                                                                                                  ö

The invention relates to immunogenic analogues of multimeric proteins each as immunogenic variants of interleukin 5 (IL5) and tumour necrosis factor alpha (TNF4) plas) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is human TNFalpha variant protein with 3 hTNF sequences joined by glycine linkers and tetahus toxoid P2 and P30 epitopes. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Multimeric protein; interleukin 5; IL5; TNFalpha; inflammatory disease; tumour necrosis factor alpha; gene therapy; arthritis; human; mutant; variant; tetanus toxoid; epitope; mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New immunogenic analogue of a polymeric protein, useful for preparing composition for treating inflammatory diseases e.g. arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to immunogenic analogues of multimeric proteins each as immunogenic variants of interleukin 5 (IL5) and tumour necrosis factor alpha (TNP, TNPalpha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is human TNRalpha variant protein with 3 hTNF sequences joined by glycine linkers and tetamus toxoid P2 and P30 epitopes. This sequence is used to illustrate the method of the invention

The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (IL5) and tumour necrosis factor alpha (TNF, TNFalpha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is human TNFalpha variant protein with 3 hTNF sequences joined by glycine linkers and tetahus toxoid P2 and P30 epitopes. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CEA; immune response; carcinoembryonic antigen; antígen presenting cell; APC; cytostatic; vaccine; human; tetanus toxoid; p2; p30; antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New immunogenic analogue of a polymeric protein, useful for preparing composition for treating inflammatory diseases e.g. arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (IL5) and tumour necrosis factor alpha (TWP. TNPalpha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is human TMPalpha variant protein. The variant comprises 3 hTMF sequences joined by glycine linkers and tetanus toxoid P2 and P30 epitopes. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                         New immunogenic analogue of a polymeric protein, useful for preparing a composition for treating inflammatory diseases e.g. arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Multimeric protein; interleukin 5; IL5; TNFalpha; inflammatory disease; tumour necrosis factor alpha; gene therapy; arthritis; human; mutant; variant; tetanus toxoid; epitope; mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to inducing an immune response against autologous carcinoembryonic antigen (CEA) in an animal, e.g. human. The method involves effecting uptake and processing by antigen presenting cells (APCB) in the animal of at least 1 modified CEA polypeptide or of a mucleic acid encoding the modified CEA polypeptide or of a microorganism or virus expressing the modified CEA polypeptide to induce a CTL response and an antibody response that targets the autologous CEA. The method is useful in immunizing actively against diseases characterized by cells that express CEA. The present sequence represents a truncated human CEA polypeptide that has tetanus toxoid (TT) P2 and P30 epitopes introduced
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Inducing an immune response in humans against autologous carcinoembryonic antigen (CEA) comprises administering a modified CEA polypeptide, a nucleic acid encoding the polypeptide, or a microorganism expressing the

therapeutic agent to a neuronal cell, which comprises a binding domain (archive) that binds to the neuronal cell and a translocation domain (amino terminal half of HG, designated as a translocation domain (amino terminal half of HG, designated as HM), that translocates the therapeutic agent into the neuronal cell, where the translocates the therapeutic domain of a clostridial neurotoxin and is not a fragment or derivative of a HN domain of a clostridial toxin. Polypeptides of the invention are useful for the treatment of a disease state associated with neuronal cells. The polypeptide constructs are useful for delivering therapeutic substances to neuronal cells. They are useful for reat disorders of the CNS including neurodegenerative diseases, stroke, epilepsy, brain tumours and infection. They are also useful in gene therapy. The present sequence is modified clostridial heavy chain fragment. This sequence is constructed by fusing the truncated binding domain of tetanus neurotoxin (Updated on 11
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

New hybrid protein of superoxide dismutase and tetanus toxin fragment C - having increased uptake by neurons and retention of enzymatic activity in these cells, for treating neurological diseases associated with oxidative

```
The present sequence represents an enzymatically active human copper-zinc superoxide dismutase (SOD-1) fused at its carboxyl terminus with the tetanus toxin fragment C (TTC) moiety. The TTC moiety constitutes amino-acid residues 865-1315 of the tetanus holotoxin. The hybrid protein, referred as SOD:Tet451, is claimed to have the following properties: (a) it exhibits Cu/Zn SOD enzymatic activity; (b) the TTC moiety selectively binds to nerve cells and allows uptake of the hybrid protein into these cells; and (c) it retains substantial SOD enzymatic activity following neurological disporders associated with oxidative stress, e.g. stroke, brain hypoxia-reperfusion, epilepsy, Parkinson's and Huntington's diseases. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a fusion protein, comprising a protein used for immunising against shed antigen-specific B cells linked to a fragment of tetanus protein. It is used in vaccines of the invention. The specification describes a method for inducing an immune response reactive with idiotypes present on shed antigen-specific B cells (SAB) of an individual. The method involves administering a vaccine formulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Inducing an immune response against shed antigen-specific B cell idiotypes, by administering a vaccine formulation comprising polynucleotides encoding an idiotypic determinant or peptides comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Shed antigen-specific B cell antigen linked to tetanus toxin fragment C.

ö
comprising polynucleotide encoding an idiotype of an antibody that binds to an epitope of shed antigen. The method is useful for inducing an immune response reactive with idiotypes present on SAB of an individual. The method is useful for depleting shed antigen-specific B cells, and for treating immune complex-mediated disease progression in organ specific autoimmune disease exacerbated by humoral immune response against groups expressed on shed antigen, or by plasma cell production of antibodies against groups of shed antigen. It is useful in cancer therapy and for treating autoimmune disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a non toxic polypeptide, for delivery of a therapeutic agent to a neuronal cell, which comprises a binding domain (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocates the therapeutic agent into the neuronal cell, where the translocation domain is not a HN domain of a clostridial neurotoxin and is not a fragment or derivative of a HN domain of a clostridial neurotoxin and is not a fragment or derivative of useful for the treatment of a disease state associated with neuronal cells. The polypeptide constructs are useful for delivering therapeutic substances to neuronal cells. They are useful to treat disorders of the CNS including neurodegenerative diseases, stroke, epilepsy, brain tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New non toxic polypeptide for delivery of a therapeutic agent for the treatment of a CNS disorder comprising a binding domain that translocates the therapeutic agent into the neuronal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Neuronal cell; binding domain; translocation domain; stroke; epilepsy; tumour; infection; neurodegenerative disease; gene therapy; chimeric; diphtheria neurotoxin; tetanus neurotoxin; TeNT.

The invention relates to a conjugate comprising an injected bacterial effector protein and a carrier that targets the effector protein to a target cell. Pharmaceutical composition of the invention is useful for a treatment selected from promoting or inhibiting survival of cells, preventing and reversing damage to cells, killing cells; promoting or inhibiting the growth of cells, apoptosis, release of an inflammatory inhibiting and reversing damage to cells, killing cells; promoting or inhibiting and reversing of cells, and treating intracellular infection, for interfering with intracellular cell, for intracellular infection, for interfering with intracellular cell, for intracellular infection, for interfering with intracellular trafficking, for modulating expression of cell-surface markers and for inhibiting secretion from cells. The invention is also useful for treating prion disease, Alzheimer' disease and wide range of disorders including muscle spasms such as blephorospasm, torticolis and
                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Conjugate for modulating cell survival and cell growth, modulating release of inflammatory mediator from cells, comprises injected bacterial effector protein and a carrier that targets the protein to target cell.
        The present sequence
and infection. They are also useful in gene therapy. The present sequencis modified clostridial heavy chain fragment. This sequence is constructed by fusing the binding domain of tetanus neurotoxin (TeNT) with translocation domain of diphtheria neurotoxin. (Updated on 11-SEP-2003 to standardise OS field)

ö
hypersecretion disorders such as chronic obstructive pulmonary disease (COPD), bronchitis and asthma. The present sequence is a fusion construct comprising Corymebacterium diphtheriae diphtheria toxin translocation domain (Dip-HN domain) and Clostridium tetani tetanis neurotoxin binding domain (TeNt-HC). This sequence is used in the exemplification of the invention. (Updated on 23-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Conjugate for modulating cell survival and cell growth, modulating release of inflammatory mediator from cells, comprises injected bacterial effector protein and a carrier that targets the protein to target cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a conjugate comprising an injected bacterial effector protein and a carrier that targets the effector protein to a target cell. Pharmaceutical composition of the invention is useful for a treatment selected from promoting or inhibiting survival of cells, preventing and reversing damage to cells; killing cells; promoting or inhibiting the growth of cells, poptosis, release of an inflammatory mediator from cells, division of cells and treating intracellular infection and regulating nitric oxide release from cells. The invention is useful in the manufacture of a medicament for treating a neuronal cell, for intracellular infection, for interfering with intracellular trafficking, for modulating expression of cell-surface markers and for inhibiting secretion from cells. The invention is also useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Apoptosis; therapy; inflammatory mediator; intracellular trafficking; infection; Prion disease; Alzheimer' disease; hypersecretion disorder; muscle spasm; COPD; bronchitis; chronic obstructive pulmonary disease; torticolis; blephorospasm; asthma; fusion protein; tetanus neurotoxin; diphtheria toxin; TeNT; translocation domain; HN domain; DipT; Hc; binding domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       inhibiting secretion from cells. The invention is also userum interesting Prion disease, Alzheimer' disease and wide range of disorders
                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                           ö
                                                                                                                                                                       Length 665;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a conjugate comprising an injected bacterial effector protein and a carrier that targets the effector protein to a target cell. Pharmaceutical composition of the invention is useful for a treatment selected from promoting or inhibiting survival of cells, preventing and reversing damage to cells, killing cells, promoting or inhibiting the growth of cells, apptosis, release of an inflammatory mediator from cells, division of cells and treating intracellular infection and regulating nitric oxide release from cells. The invention is useful in the manufacture of a medicament for treating a neuronal cell, for intracellular infection, for interfering with intracellular trafficking, for modulating expression of cell-surface markers and for inhibiting secretion from cells. The invention is also useful for

cantigens (PA) such as those associated with cancers (self-proteins), e.g. human prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 8b (FGF8b). The method comprises effecting simultaneous presentation by antigen producing cells (APC8) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least 1 E-cell group derived from the cell-associated PA; and (2) at least 1 first T helper cell group which is foreign to the animal. Analogues of human PSM, human Her2 and predicted CTL and B-cell epitopes of the respective PA and including at least noe foreign T helper epitopes of the respective PA and including to the treat prostate, prostate, prostate, prostate, prostate, prostate, prostate, prostate or breast cancer when the PA is human PSM, FGF8b and Har2, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Prostate specific membrane antigen; immunogenized construct; mutant; vaccination; cytotoxic T-lymphocyte immunity; breast cancer; PSM; prostate cancer; cell-associated peptide antigen; foreign epitope.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Mutant human PSM antigen splice variant construct, hPSM'8.3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Inducing immune responses to weakly immunogenic, tumor as antigens for the treatment of breast and prostate cancer.

The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Dalum I;

CC AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are confirmed to the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. thuran prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 80 (FGR8D). The method comprises effecting simultaneous presentation by antigen producing cells (APC8) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and (Or at least 18 -cell group derived from the C cell-associated PA, and (2) at least 1 B-cell group derived from the C foreign to the animal. Analogues of human PSM, human Her2 and c predicted CTL and B-cell epitopes of the respective PA and including at correct prostate, prostate/breast or breast cancer when the PA is human PSM, FGF8b and Her2, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187 confit the specification Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer. Prostate specific membrane antigen; splice variant; mutant; vaccination; cytotoxic T-lymphocyte immunity; breast cancer; prostate cancer; cell-associated peptide antigen; foreign epitope. 100.0%; Score 112; DB 3; Length 693; 100.0%; Pred. AAY92659-62 are mutant immunogenized murine prostate specific membrane antigen (PSM) constructs, which contain a foreign epitope, P30. The analogues can be used to study whether autocolerance to mouse PSM can be broken in mice by immunisation and/or DNA vaccination against murine PSM cusing murine PSM analogues. Immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. The method is seciated peptide antigens (PA) such as those associated with cancers casociated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. human PSM, heregulin 2 (Her2) and/or fibroblast growth factor 8b (PGP8b). The method comprises effecting simultaneous presentation by antigen producing cells (PAC8) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the call-associated PA is and (2) at least 1 first T helper cell group which is foreign to the animal. Analogues of human PSM, human Her2 and human/murine PGP8b comprising a substantial part of all known and predicted CTL and B-cell epitope are also claimed. The method is used to treat prostate, PESB and prostate/breast or breast cancer when the PA is human PSM, FGP8b and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Prostate specific membrane antigen, splice variant, mutant, vaccination, cytotoxic T-lymphocyte immunity, breast cancer, prostate cancer, cell-associated peptide antigen, foreign epitope.
                                                                                                                                                                                                                                                                                                                                                                                       Her2, respectively. AAY92659-62 are mutant immunogenized murine prostate specific membrane antigen (PSM) constructs, which contain a foreign epitope, P30. The analogues can be used to study whether autocolerance to mouse PSM can be broken in mice by immunisation and/or DNA vaccination against murine PSM using murine PSM analogues. Immunogenic analogues of PSM can be used in the claimed method as an autovoaccine to induce a CTL response. The method is used for inducing immune responses against weakly immunogenic cellassociated peptide antigens (PA) such as those associated with cancers (Self-proteins), e.g. human PSM, heregulin 2 (Herz) and/or fibroblast growth factor 8b (FGF8b). The method comprises effecting simultaneous presentation by antigen producing cells (APCs) of the animals immune the PA and/or at least 1 B-cell group derived from the coll-associated PA and (2) at least 1 B-cell group derived from the coll-associated PA and (2) at least 1 B-cell group derived from the fGF8b comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper comprising are abstantial part of all known and predicted CTL and B-cell epitope are also claimed. The method is used to treat prostate, prostate, breast or breast cancer when the PA is human PSM, FGF8b and Herz, respectively. Note: This sequence was constructed from the murine constitie, and including an pages 210-213 of the tumor associated peptide Inducing immune responses to weakly immunogenic, tumor as antigens for the treatment of breast and prostate cancer.

ö The invention relates to inducing an immune response against autologous carcinoembryonic antigen (CEA) in an animal, e.g. human. The method involves effecting uptake and processing by antigen presenting cells (APCs) in the animal of at least I modified CEA polypeptide or of a mucleic acid encoding the modified CEA polypeptide or of a microorganism or virus expressing the modified CEA polypeptide to induce a CTL response and an antibody response that targets the autologous CEA. The method is useful in immunizing actively against diseases characterized by cells that express CEA. The present sequence represents a modified human CEA polypeptide that has tetanus toxoid (TT) P2 and P30 epitopes introduced ö Length 708; Indels 100.0%; Score 112; DB 7; 100.0%; Pred. carcinoembryonic antigen (CEA) in an animal, e.g. human. The method involves effecting uptake and processing by antigen presenting cells (APCs) in the animal of at least I modified CEA polypeptide or of a nucleic acid encoding the modified CEA polypeptide or of a microorganism or virus expressing the modified CEA polypeptide to induce a CTL response and an antibody response that targets the autologous CEA. The method is useful in immunizing actively against diseases characterized by cells that express CEA. The present sequence represents a modified human CEA polypeptide that has tetanus toxoid (TT) P2 and P30 epitopes introduced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer,

preserved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide artigens (PA) such as those associated with cancers (Self-proteins), e.g. human prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 8b (FGF8b). The method comprises effecting is simultaneous presentation by antigen producing cells (APCs) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and (2) at least 1 B-cell group derived from the Cell-associated PA; and (2) at least 1 first T helper cell group which is foreign to the animal. Analogues of human PSM, human Her2 and chuman/murine PGP8b comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least tone foreign T helper epitope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, FGP8b and Her2, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187
                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.

utovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immunogenized forms. The method is used for inducing immunogenized forms. The method is used for inducing antigens (PA) such as those associated with cancers (self-proteins), e.g. human prostate specific membrane antigen (FBA), heregulin 2 (Herz) and/or human prostate specific membrane antigen (FBA), heregulin 2 (Herz) and/or cimultaneous presentation by antigen producing cells (APCs) of the simultaneous presentation by antigen producing cells (APCs) of the canimals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least 1 B-cell group derived from the Cell-associated PA, and (2) at least 1 first T helper cell group which is foreign to the animal. Analogues of human PSM, human Herz and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, PGF8b and HBP2, respectively. Note: This sequence was constructed of the specifical control of the short file of the short of the wind type human PSM (AAY92619), which appears on pages 184-187 of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                     AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic analogues of PSM can be used in the claimed method as an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Dalum I;

                                                                                                                                                       AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30).

The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody contained regions and cystaine residues involved in disulfide bonds are binding regions and cystaine residues involved in disulfide bonds are contained method is used for inducing immuno responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. human prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 80 (FGP8D). The method comprises effecting simultaneous presentation by antigen producing cells (APCs) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/Or at least 1 B-cell group derived from the C cell-associated PA, and (2) at least 1 Eirst T helper cell group which is foreign to the animal. Analogues of human PSM, human Her2 and channal man and comprising a substantial part of all Known and congrising a substantial part of all Known and congrising a substantial part of all Known and congrising a substantial part of all Known and congrising a substantial part of all known and congrising a congrising a concer when the PA and including at the treat prostate, prostate or breast concer when the PA is human concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and concerns and con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                        Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PSM, FGF8b and Herz, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187 of the specification

antigen (PSM) constructs, which contain foreign epitchies membrane antigen (PSM) constructs, which contain foreign epitches (P2 and/or P30).

The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. human prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 80 (FGF8D). The method comprises effecting simultaneous presentation by antigen producing cells (APC8) of the orimals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least 1 Eirst T helper cell group which is coreign to the animal. Analogues of human PSM human Her2 and human/murine FGF8D comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at the ast one foreign T helper epitope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is and SM (AAY92619), which appears on pages 184-187
                                                                                                                                                                                                                                                              Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.

Affiliation (PSM) constructs, which contain foreign epitopes (P2 and/or P30).

The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are binding regions and cysteine residues involved in disulfide bonds are conserved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with canners (Self-proteins), e.g. thuman prostate specific membrane antigen (PSM), heregulin 2 (Herz) and/or fibroblast growth factor 8b (FGF8b). The method comprises effecting simultaneous presentation by antigen producing cells (APC8) of the animals immune system of: (1) at least 1 CTL (cytocoxic T-lymphocyte) cell-associated PA; and (2) at least 1 first T helper cell group which is foreign to the animal. Analogues of human PSM, human Herz and chuman/murine FGF8b comprising a subscential part of all known and chuman/murine FGF8b comprising a subscential part of all known and cheat prostate, prostate/breast or breast cancer when the PA is human CC FSM, FGF8b and Herz, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187 of the analogues of the annex of pages region or preset the analogues of the sequence was constructed than analogues of the sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAY92627-49 are mutant immunogenized human prostate specific membrane

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAY92627-49 are mutant immunogenized human prostate specific membrane antiquen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing antigens (PA) such as those associated with cancers (self-proteins), e.g. human prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 80 kGPBb). The method comprises effecting simulates presentation by antigen producing cells (APCB) of the animals immune system of: (1) at least 1 B-cell group derived from the PA and/or at least 1 B-cell group derived from the CC animals. Analogues of human PSM, human Her2 and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human pcomprised. From the PA is human PSM (AAY92619), which appears on pages 184-187 cell from the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                             Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.

```
AXY AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenize and cyses of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are controlled by the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. antigens (PA) such as those associated with cancers (self-proteins), e.g. thuman prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 8b (FGP8b). The method comprises effecting simultaneous presentation by antigen producing cells (APC8) of the animal. Analogues of human PSM, human Her2 and comprised from the CC cell-associated PA; and (2) at least 1 B-cell group derived from the CC cell-associated PA; and (2) at least 1 B-cell group which is corein to the animal. Analogues of the respective PA and including at the predicted CTL and B-cell epitopes of the respective PA and including at the predicted CTL and B-cell epitopes of the respective PA and including at the bundan Murrine FGP8b comprising a substantial part of all known and conference of the per epitope are also claimed. The method is used to treat prostate, prostate, breast cancer when the PA is human PSM, FGF8b and Her2, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187 of the breast properse or pages 184-187.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Haaning J, Leach D, Dalum I;

RESULT 187 AAY92638

```
AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSW) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. numan prostate specific membrane antigen (PSM), heregulin 2 (Herz) and/or fibroblast growth factor 8b (FGP8b). The method comprises effecting simultaneous presentation by antigen producing cells (APCS) of the canimals immune system of: (1) at least 1 Ctl (cytocoxic T-lymphocyte) group derived from the PA and/or at least 1 B-cell group derived from the cell-associated PA; and (2) at least 1 first T helper cell group which is construction of the parantal producing cells for the parantal producing cell group which is construction to the animal Analogues of human PSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, human HSM, h
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   human/muxine FGF8b comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used to trat prostate, prostate/breast or breast cancer when the PA is human PSM, FGF8b and Her2, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Dalum I;

AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated poptide artifices (PA) such as those associated with cancers (self-proteins), e.g. human prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 8b (FGF8b). The method comprises effecting simultaneous presentation by antigen producing cells (APCS) of the animals immune system of: (1) at least 1 B-cell group derived from the Call-associated PA, and (2) at least 1 E.cell group derived from the cell-associated PA, and (2) at least 1 E.cell group which is foreign to the animal. Analogues of human PSM, human Her2 and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human CPSM, FGF8b and Her2, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187 of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.

AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (BSM) constructs, which contain foreign epitopes (P2 and/or P30). The fimunogenic analogues of PSM can be used in the calained method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. human prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 80 (FGFBD). The method comprises effecting simultaneous presentation by antigen producing cells (APCS) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) crossing derived from the PA and/or at least 1 B-cell group derived from the cell-associated PA, and (2) at least 1 first T helper cell group which is foreign to the animal. Analogues of human PSM, human Her2 and
                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Dalum I;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g.
human/murine FGF8b comprising a substantial part of all known and predicted CTL and B-cell epicopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, FGF8b and Her2, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Dalum I;

human prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 8b (FGF8b). The method comprises effecting elimultaneous presentation by antigen producing cells (APCs) of the animals immune system of: (1) at least 1 CTL (Cyctoxic T-1ymphocyte) group derived from the PA and/or at least 1 B-cell group derived from the PA and/or at least 1 B-cell group derived from the cell-associated PA; and (2) at least 1 first T helper cell group which is foreign to the animal. Analogues of human PSM, human Her2 and human/murine FGF8b comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used to traat prostate, prostate/breast or breast cancer when the PA is human PSM, FGF8b and Her2. respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Dalum I;

contigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30).

The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. human prostate specific membrane antigen (PSM), heregulin 2 (Herz) and/or contributed growth factors Bb (FGPBb). The method comprises effecting simultaneous presentation by antigen producing cells (ApCB) of the animals immune system of: (1) at least 1 CTL (Cytotoxic T-lymphocyte) group derived from the PA and/or at least 1 B-cell group derived from the cell-associated PA, and (2) at least 1 Eirst 7 helper cell group which is consign to the animal. Analogues of human PSM, human Herz and predicted CTL and B-cell epitopes of the respective A and including at predicted CTL and B-cell epitopes of the respective PA and including at class to foreign to reat prostate, prostate/breast or breast cancer when the PA is human PSM, FSM, FSBB and HBrz, respectivelly. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187 of the specification

AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenize antigen of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immuno erisponses against weakly immunogeniz cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. human prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 8b (FGF8b). The method comprises effecting simulateneous presentation by antigen producing cells (APCs) of the animals immune system of: (1) at least 1 and sold group which is growing derived from the PA and/or at least 1 and layoup derived from the PA and/or at least 1 and layoup derived from the PA and/or at least 1 and layoup derived from the PA and/or at least 1 and layoup derived from the PA and or all associated PA; and (2) at least 1 and and and including at credited CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used to the animal type human PSM, which appears on pages 184-187 cell the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ô
                Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Prostate specific membrane antigen; immunogenized construct; mutant; vaccination; cytotoxic T-lymphocyte immunity; breast cancer; prostate cancer; cell-associated peptide antigen; foreign epitope.

AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenize antigones of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are controlled by the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. antigens (PA) such as those associated with cancers (self-proteins), e.g. thuman prostate specific membrane antigen (PSM), heregulin 2 (Herz) and/or fibroblast growth factor 8D (PGP8D). The method comprises effecting simultaneous presentation by antigen producing cells (APCS) of the simula system of: (1) at least 1 CTL (cytcoxof T-1ymphocyte) croll-associated PA, and (2) at least 1 B-cell group derived from the PA and/or at least 1 B-cell group derived from the CT coll-associated PA, and (2) at least 1 B-cell group derived from the CT coll-associated PA, and (2) at least 1 B-cell group which is contained. The method of a used contained of the respective PA and including at contained crostate, prostate prostate also claimed. The method is used to the wild type human PSM (AAY92619), which appears on pages 184-187
                                                                                                                                                                                                                                                                                                                                Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Prostate specific membrane antigen; immunogenized construct; mutant; vaccination; cytotoxic T-lymphocyte immunity; breast cancer; prostate cancer; cell-associated peptide antigen; foreign epitope.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mutant human prostate specific membrane antigen construct, hPSM6.3.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The Immunogenic analogues of the response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are binding regions and cysteine residues involved in disulfide bonds are binding regions and cysteine residues involved in disulfide bonds are binding regions and cysteine residues involved in disulfide bonds are controlled immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. muan prostate specific membrane antigen (PSM), heregulin 2 (Herz) and/or fibroblast growth factor 80 (FGP8D). The method comprises effecting simultaneous presentation by antigen producing cells (APCS) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least 1 B real group derived from the cell-associated PA, and (2) at least 1 Brown human Herz and consprising a substantial part of all known and preciped CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, RGF8b and Herz, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187 cof the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                 AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic analogues of PSM can be used in the claimed method as an

AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenize antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenize all and a care antibody as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are confirmed in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. antigens (PA) such as those associated with cancers (self-proteins), e.g. than intostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 80 (FGP8D). The method comprises effecting simultaneous presentation by antigen producing cells (APCS) of the animal famune system of: (1) at least 18—cell group derived from the Co-call-associated PA, and (2) at least 18—cell group which is coll-associated PA, and (2) at least 18—cell group which is comparable to the animal. Analogues of human PSM, human Her2 and channel correct on the animal. Analogues of the respective PA and including at predicted CTL and B-cell epitopes of the respective PA and including at the treat prostate, prostate/Phreast or breast cancer when the PA is human PSM FRTRA and HAL2 respectively. Where THE PA is human PSM FRTRA and HAL2 respectively.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               to treat prostate, prostate/breast or breast cancer when the PA is humar PSM, FGF8b and Her2, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187 of the specification

Mutant murine prostate specific membrane antigen construct, mPSMX.

Prostate specific membrane antigen; immunogenized construct; mutant; vaccination; cytotoxic T-lymphocyte immunity; breast cancer; prostate cancer; cell-associated peptide antigen; foreign epitope.

Mus musculus,

```
AAYYZASY-62 are mutant Immunogenized mutine prostace specific whembrane antigen (PSM) constructs, which contain a foreign epitope, P30. The analogues can be used to study whether autotolerance to mouse PSM can be observed to mine by immunisation and/or DNA vaccination against mutine PSM cusing mutine. PSM analogues: Immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. The method is used for inducing immune responses against weakly immunogenic cellcassociated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. human PSM, heregulin 2 (Herz) and/or fibroblast crowth factor 8b (FGF8b). The method comprises effecting simultaneous presentation by antigen producing cells (APCS) of the animals immune system of: (1) at least 1 Ercell group derived from the cell-associated particle and or at least 1 B-cell group derived from the cell-associated particle and a substantial part of all known and predicted CTL and B-cell comprising a substantial part of all known and predicted CTL and B-cell ceptopes of the respective PA and including at least one foreign T helper ceptopes are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, FGF8b and Herz, respectively. Note: This sequence was constructed from the wild
                                                                                                                                                                                                                                                                                                                                                                                                           Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.

AAY92659-62 are mutant immunogenized murine prostate specific membrane antigen (PSM) constructs, which contain a foreign epitope, P30. The analogues can be used to study whether autocolerance to mouse PSM can be broken in mice by immunisation and/or DNA vaccination against murine PSM using murine PSM analogues. Immunogenic analogues of PSM can be used in the claimed method as an autovoaccine to induce a CTL response. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-protein), e.g. human PSM, heregulin 2 (Hex2) and/or fibroblast growth factor 8b (FGF8b). The method comprises effecting simultaneous presentation by antigen producing cells (APCs) of the animals immune cyperentation by antigen producing cells (APCs) of the animals immune the PA and/or at least 1 B-cell group derived from the cell-associated PA control Analogues of human PSM, human Herz and human/murine FGR8b comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper cell comprishing are also claimed. The method is used to treat prostate, prostate, prostate, breast cancer when the PA is human PSM, FGF8b and Herz, respectively. Note: This sequence was constructed from the wind raper fields.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Dalum I;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 TeNT-Hc-DipT HN domain-thrombin linker-SpiC protein fusion construct.

```

The invention relates to a conjugate comprising an injected bacterial effector protein and a carrier that targets the effector protein to a target cell. Pharmaceutical composition of the invention is useful for a treatment selected from promoting or inhibiting survival of cells, promoting or preventing and reversing damage to cells; killing cells; promoting or inhibiting the growth of cells, apoptosis, release of an inflammatory mediator from cells, division of cells and treating intracellular confiction and regulating nitric oxide release from cells. The invention is useful in the manufacture of a medicament for treating a neuronal cell, for intracellular infection, for interfering with intracellular cell, for intracellular infection, for interfering with intracellular infection, for interfering with intracellular infection, for interfering with intracellular cells. The invention is also useful for inhibiting secretion from cells. The invention is also useful for treating Prion disease, Alzheimer disease and wide range of disorders including muscle spasms such as blephorospasm, torticolis and disorders including muscle spasms such as chronic obstructive pulmonary disease (COPD), bronchitis and asthma. The present sequence is a fusion construct of an expension of cells of the constructive pulmonary dispensed comparising Corpusabeterium disphtheriae diphtheriae confirmation of the constructive pulmonary dispensed comparisons. domain (DipT-HW domain), Clostridium tetami tetamus neurotoxin binding domain (TeNT-Hc), thrombin linker peptide and Salmonella typhimurium Spic protein. This sequence is used in the exemplification of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Chimeric
```

The invention relates to a conjugate comprising an injected bacterial effector protein and a carrier that targets the effector protein to a carget call. Pharamaceutical composition of the invention is useful for a treatment selected from promoting or inhibiting survival of cells; promoting or inhibiting the growth of cells, apoptosis, release of an inflammatory mediator from cells, division of cells and treating intracellular infection and regulating nitric oxide release from cells. The invention is useful in the manufacture of a medicament for treating intracellular cells, for intracellular infection, for interfering with intracellular cells, for intracellular infection, for interfering with intracellular cells, for intracellular infection, for interfering with intracellular cells, for interfering with intracellular cells, for interfering with intracellular cells, for interfering with intracellular cells, individual infection, for special or special for inhibiting secretion from cells. The invention is also useful for cell-ding muscle spasms such as blephorospasm, torticolls and hypersecretion disorders such as blephorospasm, torticolls and hypersecretion disorders such as blephorospasm, torticolls and comprising corynebacterium diphtheriae diphtheria toxin translocation domain (DipT-HW domain), Clostridium tetani tetanus neurotoxin binding comprision comprision of the exemplification of the nvention

Generating an immune response to an antigen, useful for generating desired T cell responses comprises administering an immunoglobulin having one peptide epitope of the antigen attached to the immunoglobulin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a method for generating an immune response to an antigen in a patient. The method comprises administering to the patient an immunoglobulin (Ig) or its portion where the Ig has at least one peptide epitope of the antigen attached to the Ig or its portion and administering the immunoglobulin or its portion in conjunction with a RNA segment. The present sequence is an antigen sequence, used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Length 875;

Modified clostridial heavy chain-superoxide dismutase conjugate #1. AAE07889 standard; protein; 882 AA. 507 FNNFTVSFWLRVPKVSASHLE 527 (first entry) 01-NOV-2001 AAE07889; RESULT 201 AAE07889

Neuronal cell; binding domain; translocation domain; stroke; epilepsy; tumour; infection; neurodegenerative disease; gene therapy; chimeric; superoxide dismutase; SOD; diphtheria neurotoxin; tetanus neurotoxin; TeNT.

Corynebacterium diphtherlae. Clostridium tetani. WO200158936-A2. Synthetic Chimeric

Geobacillus stearothermophilus.

```
The invention relates to a non toxic polypeptide, for delivery of a therapeutic agent to a neuronal cell, which comprises a binding domain (carboxy terminal half of heavy chain (H) of a neurotoxin, designated as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocation domain is not a HN domain of a clostridial toxin. Polypeptides of the invention are a HN domain of a clostridial toxin. Polypeptides of the invention are a HN domain of a clostridial toxin. Polypeptides of the invention are cells. The polypeptide constructs are useful for delivering therapeutic substances to neuronal cells. They are useful for delivering therapeutic colls. They are also useful in gene therapy. The present sequence of m modified clostridial heavy chain-superoxide dismutase conjugate. This conjugate comprises a mitochondrial leader sequence from human Mn-superoxide dismutase (MnSOD), MnSOD from Bacillus stearothermophilus, conjugate and eleaved by factor Xa, translocation domain from a confinent and a neuronal cell-specific binding domain from
                                                                                                                                                                                                                                                                                                                                New non toxic polypeptide for delivery of a therapeutic agent for the treatment of a CNS disorder comprising a binding domain that translocates the therapeutic agent into the neuronal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  TeNT-Hc-DipT HN domain-factor Xa linker-YopT protein fusion construct.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Apoptosis, therapy, inflammatory mediator; intracellular trafficking; infection, Prion disease, Alzheimer' disease; hypersecretion disorder; muscle spasm, CODD; bronchitis; chronic obstructive pulmonary disease; torticolis; blephorospasm; asthma; fusion protein; tetanus neurotoxin; diphtheria toxin; TeNT; translocation domain; HN domain; DipT; HC; binding domain; targetted effector protien; YopT.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a non toxic polypeptide, for delivery of a therapeutic agent to a neuronal cell, which comprises a binding domain (acarboxy terminal half of heavy chain (HC) of a neurotoxin, designated as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocates the therapeutic agent into the neuronal cell, where the translocation domain is not a HN domain of a clostridial neurotoxin and is not a fragment or derivative of a HN domain of a clostridial toxin. Polypeptides of the invention are cusful for the treatment of a disease state associated with neuronal cells. The polypeptide constructs are useful for delivering therapeutic substances to neuronal cells. They are useful for the invention are constituting neurodegenerative diseases, stroke, epilepsy, brain tumours constituding neurodegenerative diseases, stroke, epilepsy, brain tumours and infection. They are also useful in gene therapy. The present sequence is modified clostridial heavy chain-euperoxide dismutase conjugate. This conjugate comprises bacterial Mn-superoxide dismutase (MnSOD), from Bacillus stearothermophilus, linker that can be cleaved by thrombin, translocation domain from diphtherial neurotoxin and a neuronal cell-
                                                                                                                                                                                                                                                                                                                                New non toxic polypeptide for delivery of a therapeutic agent for the treatment of a CNS disorder comprising a binding domain that translocates the therapeutic agent into the neuronal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Neuronal cell; binding domain; translocation domain; stroke; epilepsy; tumour; infection; neurodegenerative disease; gene therapy; chimeric; superoxide dismutase; SOD; diphtheria neurotoxin; tetanus neurotoxin;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Modified clostridial heavy chain-superoxide dismutase conjugate #3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                                                                                            Conjugate for modulating cell survival and cell growth, modulating release of inflammatory mediator from cells, comprises injected bacterial effector protein and a carrier that targets the protein to target cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 hypersecretion disorders such as chronic obstructive pulmonary disease (COPD), bronchitis and asthma. The present sequence is a fusion construct comprising Corymbacterium diphtheriae diphtheria toxin translocation domain (DipT-HN domain), Clostridium teranni tetanus neurotoxin binding domain (TeNT-HC), factor Xa linker peptide and Yersinia pestis targetted effector protien YopT. This sequence is used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a conjugate comprising an injected bacterial effector protein and a carrier that targets the effector protein to a target cell. Pharmaceutical composition of the invention is useful for a treatment selected from promoting or inhibiting survival of cells; preventing and reversing damage to cells; killing cells; promoting or inhibiting the growth of cells, apoptosis, release of an inflammatory infection and regulating nitric oxide release from cells; promoting or infection and regulating nitric oxide release from cells. The invention is useful in the manufacture of a medicament for treating a neuronal cell, for intracellular infection, for interfering with intracellular trafficking, for modulating expression of cell-surface markers and trafficking, for modulating expression of cell-surface markers and trafficking secretion from cells. The invention is also useful for intraction from cells. The invention is also useful for intraction from cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     inhibiting secretion from cells. The invention is also useful for treating Prion disease, Alzheimer' disease and wide range of disorders including muscle spaems such as blephorospasm, torticolis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Neuronal cell; binding domain; translocation domain; stroke; epilepsy; tumour; infection; neurodegenerative disease; gene therapy; botulinum neurotoxin; tetanus neurotoxin; TeNT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        C. botulinum C2 translocation domain with TeNT binding domain #2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .

The invention relates to a non toxic polypeptide, for delivery of a therapeutic agent to a neuronal cell, which comprises a binding domain (carboxy terminal half of heavy chain (HC) of a neurotoxin, designated as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocation domain is not a the neuronal cell, where the translocation domain is not a HN domain of a clostridial toxin. Polypeptides of the invention are useful for the treatment of a disease state associated with neuronal cells. The polypeptide constructs are useful for delivering therapeutic substances to neuronal cells. They are useful for delivering therapeutic culls. The pulypeptide constructs are useful for the treatment of a disease state associated with neuronal cells. They are useful to treat disorders of the CS including neurodespenerative diseases, stroke, epilepsy, brain tumours and infection. They are also useful in gene therapy. The present sequence is construct.
                                                                                                                                                                                                      New non toxic polypeptide for delivery of a therapeutic agent for the treatment of a CNS disorder comprising a binding domain that translocates the therapeutic agent into the neuronal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Neuronal cell; binding domain; translocation domain; stroke; epilepsy; tumour; infection; neurodegenerative disease; gene therapy; botulinum neurotoxin; tetanus neurotoxin; TeNT.

(MICR-) MICROBIOLOGICAL RES AUTHORITY

Conjugate for modulating cell survival and cell growth, modulating release of inflammatory mediator from cells, comprises injected bacterial effector protein and a carrier that targets the protein to target cell.

```
The invention relates to a non toxic polypeptide, for delivery of a therapeutic agent to a neuronal cell, which comprises a binding domain (acrowy terminal half of heavy chain (HC) of a neurotoxin, designated as HC) that binds to the neuronal cell and a translocation domain (amino terminal half of HC, designated as HN), that translocates the therapeutic agent into the neuronal cell, where the translocation domain is not a HN domain of a clostridial toxin. Polypeptides of the invention are a HN domain of a clostridial toxin. Polypeptides of the invention are caseful for the treatment of a disease state associated with neuronal cells. The polypeptide constructs are useful for delivering therapeutic substances to neuronal cells. They are useful for treat disorders of the CC is including neurodegenerative diseases, stroke, epilepsy, brain tumours and infection. They are also useful in gene therapy. The present sequence is C. botulinum C2 enterotoxin translocation domain with tetanus
                                                                        New non toxic polypeptide for delivery of a therapeutic agent for the treatment of a CNS disorder comprising a binding domain that translocates the therapeutic agent into the neuronal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                      100.0%; Score 112; DB 4;

The invention relates to a conjugate comprising an injected bacterial effector protein and a carrier that targets the effector protein to a cargier that targets the effector protein to a carget cell. Pharmaceutical composition of the invention is useful for a treatment selected from promoting or inhibiting survival of cells, promoting or inhibiting the growth of cells, apoptosis, release of an inflammatory mediator from cells, division of cells and treating intracellular infection and regulating nitric oxide release from cells. The invention is useful in the manufacture of a medicament for treating a neuronal cell, for intracellular infection, for interfering with intracellular trafficking, for modulating expression of cell surface markers and for inhibiting secretion from cells. The invention is also useful for treating prion disease, Alzheimer, disease and wide range of disorders including muscle spasms such as chronic obstructive pulmonary disease (COPD), bronchitis and asthma. The present sequence is a fusion construct comprising Corynebacterium diphtheriae diphtheria toxin translocation domain (Dipf-HN domain), Clostridium tetanic tetanus neurotoxin binding domain (TeNT-HC), factor Xa linker peptide and Salmonella typhimurium truncated invasion gene D protein, SigD. This sequence is used in the exemplification of the invention

The invention relates to a conjugate comprising an injected bacterial effector protein and a carrier that targets the effector protein to a target call. Pharamaceutical composition of the invention is useful for a carget call. Pharamaceutical composition of the invention is useful for a preventing and reversing damage to calls; killing calls; promoting or inhibiting the growth of calls, apoptosis, release of an inflammatory compliating the growth of calls and treating intracellular infection and regulating nitric oxide release from calls. The invention is useful in the manufacture of a medicament for treating intracellular call, for intracellular infection, for interfering with intracellular call, for intracellular infection of call-surface markers and for trafficking, for modulating expression of call-surface markers and for trafficking secretion from calls. The invention is also useful for treating prion disease, Alzheimer disease and wide range of disorders including muscle spasms such as blephorospasm, torticolis and compliance of the present sequence is a fusion construct comprising Corynebacterium diphtheriae diphtheria toxin translocation domain (DipT-HN domain), clostridium tetani tetanus neurotoxin binding chancated invasion cene D protein. This sequence is used in the
Conjugate for modulating cell survival and cell growth, modulating release of inflammatory mediator from cells, comprises injected bacterial effector protein and a carrier that targets the protein to target cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   truncated invasion gene D protein, SigD. The present sequence is given in a specification relating to a novel polypeptide comprising tetanus toxin (TeNT) fragment C or its immunogenic fragment, containing a mutation in a loop region. The mutation results in a reduction in the binding of TeNT fragment C or its immunogenic fragment to gangliosides and primary motoneurones, and/or a reduction in the ability of TeNT fragment C or its immunogenic fragment to undergo retrograde transport. The polypeptide is useful for treating, preventing and reducing the susceptibility to Clostridium tetani infection in a mid reducing the susceptibility to clostridium tetani infection in a within TeNT polypeptides. Antibody produced against the polypeptide is also useful for treating Clostridium tetani infection

New polypeptide, useful for treating infections of Clostridium tetani, comprises tetanus toxin fragment with a mutation in a loop region,.

New single chain polypeptides comprising clostridial neurotoxin light and heavy chains, useful as positive controls for toxin assays, or for developing vaccines against clostridial toxin. of The present invention describes a single chain polypeptide comprising clostridial neurotoxin light and heavy chains. The single chain polypeptide comprises 2 domains: the first domain is a clostridial neurotoxin light chain, or its fragment or variant, which is capable cleaving one or more vesicle or plasma membrane associated proteins Disclosure; SEQ ID NO 141; 588pp; English. New recombinant multivalent protein comprising antigenic determinants derived from more than one stage in a life cycle of Plasmodium vivax, useful as a vaccine for treating, preventing and reducing malarial infection.

Claim 5; Page 39-45; 59pp; English.

The invention relates to recombinant multivalent proteins (I) that stimulate an immune response to Plasmodium vivax. (I) comprises antigenic determinants, fragments or conservative substitutions, derived from more than one stage in a life cycle of a Plasmodium vivax parasite. (I) is useful as a vaccine for stimulating an immune response, specifically a

protective immune response that confers increased resistance to infection by Plasmodium parasites, such as P. vivax. (1) is especially useful in the treatment, prevention and reduction of malarial infection, as research or diagnostic reagents for the detection of Plasmodium species in a biological sample, and for conferring immunity against multiple stages of the malarial parasite. The antibodies produced are useful for the detection or measurement of antigenic epitopes derived from one more stages in a life cycle of a parasite, particularly P. vivax. The waccine comprising the recombinant proteins, is cost-effective, health-promoting intervention for controlling, preventing or treating the incidence of malaria. The present sequence represents the amino acid sequence of the recombinant protein Vivaclp, a multivalent and multistage vaccine against P. vivax

stages of the malarial parasite. The antibodies produced are useful for the detection or measurement of antigenic epitopes derived from one or more stages in a life cycle of a parasite, particularly P. vivax. The vaccine comprising the recombinant proteins, is cost-effective, health-promoting intervention for controlling, preventing or treating the health-incidence of malaria. The present sequence represents the recombinant protein. Vivac2P, a milkivalent and multistage vaccine against P. vivax
